CPE 654 FALL 2017 SEMESTER PROJECT

Transmitting or receiving data from a country to the rest of the world.

First, design a system that can selectively block certain people or devices from accessing the internet and transmitting information outside the country or receiving information into the country.

Second, show how to avoid this by designing an internet scale service that makes it impossible to block or restrict internet traffic selectively. Essentially this will provide unrestricted internet access for everyone, especially those that need it the most in repressive regimes.
